Sunrise Coffee Chain

Executive key insights

Prepared from SQL analysis, Power BI dashboards, and source CSVs

Data scope: 2023-01-01 to 2024-12-30

Performance is stable, but profit quality is uneven.

The chain has a solid margin base and loyal customer activity, yet store economics vary sharply. The biggest opportunity is not more traffic everywhere - it is fixing cost leakage in specific locations and protecting high-margin formats.

MONTHLY REVENUE

£89.7M

Across 60 stores and 24 months.

NET PROFIT

£16.9M

18.8% aggregate margin.

DAILY SALES ROWS

10,000

Operational sample for traffic and mix.

Client delivery message

Prioritize margin discipline by store, rebalance underperforming trading periods, and use loyalty to grow member value without over-discounting.

Five insights to guide the next 90 days

The story is less about demand collapse and more about store-level economics, calendar behavior, and mix management.

1

Margin is resilient, but revenue softened.

Dashboard view shows 2024 revenue down 1.6% while net margin improved slightly. Cost control protected profit quality.

2

Transport-Hub stores are small but powerful.

Only 2 stores, yet they deliver 25.1% aggregate margin versus 18.6% for High-Street.

3

A few stores are leaking profit.

South London Corner lost £50.5K over 24 months; Canary Wharf Express has 21.8% rent share and weak profit.

4

Revenue mix is coffee-led, with food as the second lever.

Espresso contributes 45.7% of daily revenue; food contributes 26.1% and should be optimized, not treated as secondary.

5

Weekends and bank holidays are under-monetized.

Average daily revenue falls roughly 24% on weekends and 33% on UK bank holidays versus regular days.

Recommended executive focus

- Fix store cost-to-sales outliers first.
- Convert traffic into ATV and margin, not just transactions.
- Protect Transport-Hub playbook and test expansion criteria.
- Use calendar-specific offers for weekends and bank holidays.
- Track rent, staffing, COGS, and loyalty cost as a profit bridge.

Profitability Architecture

TRANSPORT-HUB MARGIN

25.1%

Higher than High-Street despite smaller footprint.

HIGH-STREET MARGIN

18.6%

Revenue scale is strong, but costs dilute profit.

RENT/PROFIT SIGNAL

-0.393

SQL correlation: higher rent is not translating into profit.

DWELL IMPACT

0.12

Weak relationship with revenue; experience alone is not enough.

Aggregate net profit margin by format

What this means

- Transport-Hub should be treated as a premium operating model, not just a small segment.
- High-Street volume is valuable, but rent and staffing discipline decide final profit.
- Expansion decisions should use profit-per-cost metrics, not revenue alone.

Client takeaway

Do not chase generic growth. Scale the store model where unit economics are proven, and require high-rent stores to clear a stricter revenue-per-cost hurdle.

Store-Level Profit Leakage

Where management attention should go first

SOUTH LONDON CORNER

-£50.5K

13 loss months / 24; high footfall but negative profit.

CANARY WHARF EXPRESS

21.8%

Rent share of revenue; 13 loss months and only £42.8K profit.

EAST LONDON LOUNGE

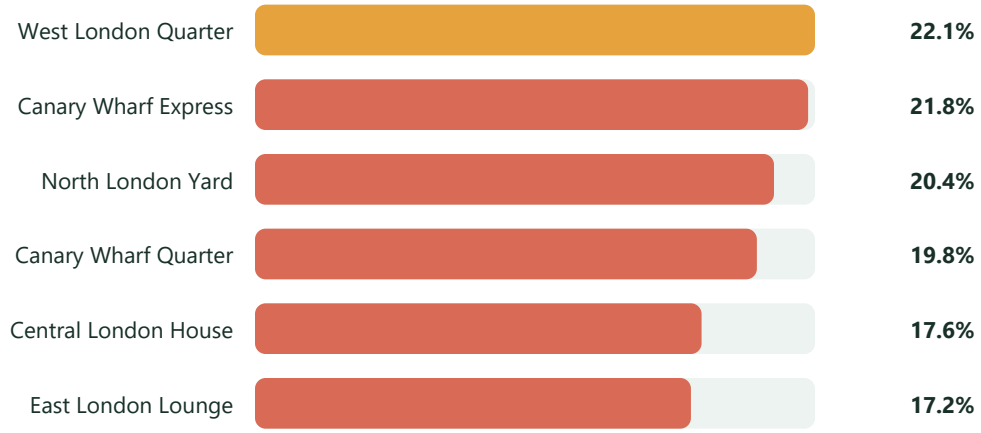

£1.71M

High revenue but only 9.6% margin; staffing and COGS pressure.

Top stores by 24-month net profit

Highest rent share of revenue

Action lens Create a store turnaround list using loss months, rent share, staffing intensity, and COGS share. Review South London Corner and Canary Wharf Express first.

Customer, Loyalty and Revenue Mix

Where the commercial engine is strongest

TRANSACTIONS

1.39M

2024 dashboard volume, down 1.64% vs LY.

LOYALTY ADOPTION

31.6%

440K loyalty transactions in dashboard view.

AVERAGE T VALUE

£7.48

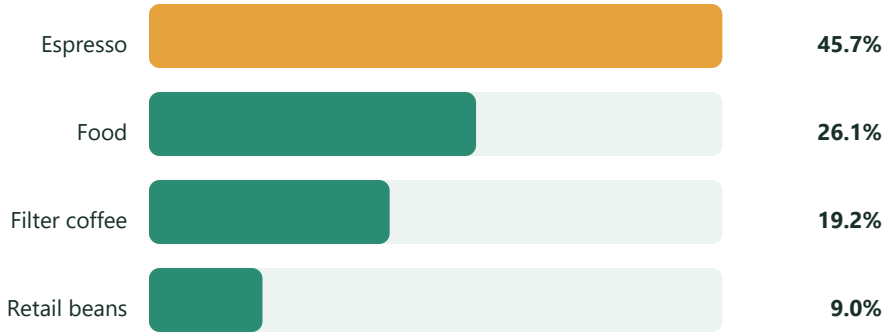

Core lever for profitable growth.

REDEMPTION COST

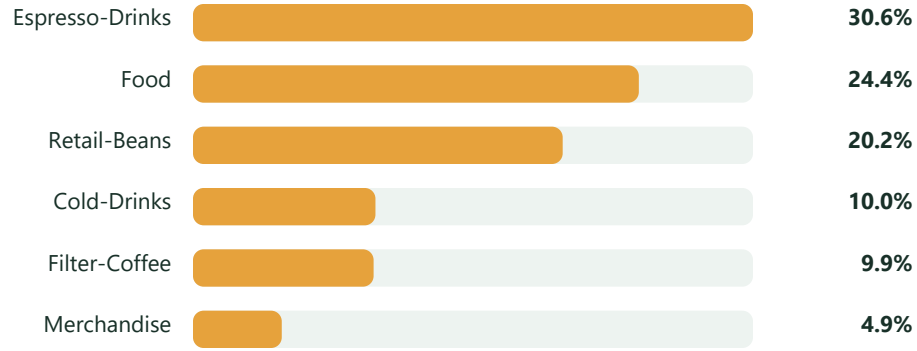

2.11%

Manage benefits without eroding margin.

Daily revenue mix by type

Product-category revenue share

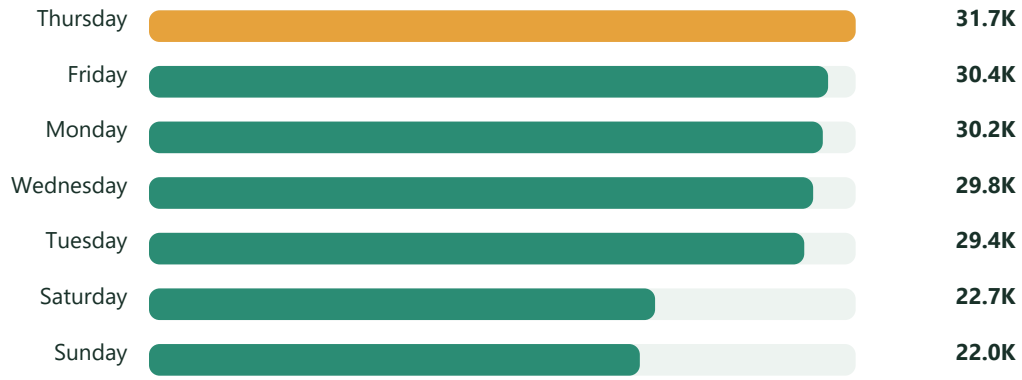

Commercial implication

Espresso is the anchor at 45.7% of daily revenue, but food at 26.1% is large enough to influence margin and basket size. Loyalty should be steered toward attach-rate and ATV uplift, not just discount redemption.

Trading Calendar and Operations

Demand is not evenly distributed

Average daily revenue by weekday

WEEKEND REVENUE

£1.66K

Average daily-sale row revenue vs £2.20K weekdays.

BANK HOLIDAY

£1.38K

Regular day average is £2.06K.

WEEKEND FOOTFALL

302

Versus 399 on weekdays.

HOLIDAY FOOTFALL

247

Versus 375 on regular days.

Opportunity

- Use Thursday and Friday as proven peak commercial windows.
- Build weekend bundles around espresso plus food to lift basket size.
- Treat bank holidays as a separate operating plan: smaller staffing base, localized offers, and product mix control.

Recommended Priority Roadmap

0-30 days

Stabilize

Turnaround review for loss-making and high-rent stores. Lock rent, staffing, COGS, and loyalty cost into a weekly margin bridge.

31-60 days

Optimize

Pilot weekend and bank-holiday bundles in selected stores. Tune loyalty incentives toward attach-rate and ATV uplift.

61-90 days

Scale

Codify the Transport-Hub operating playbook and define expansion thresholds using profit per rent and staffing pound.

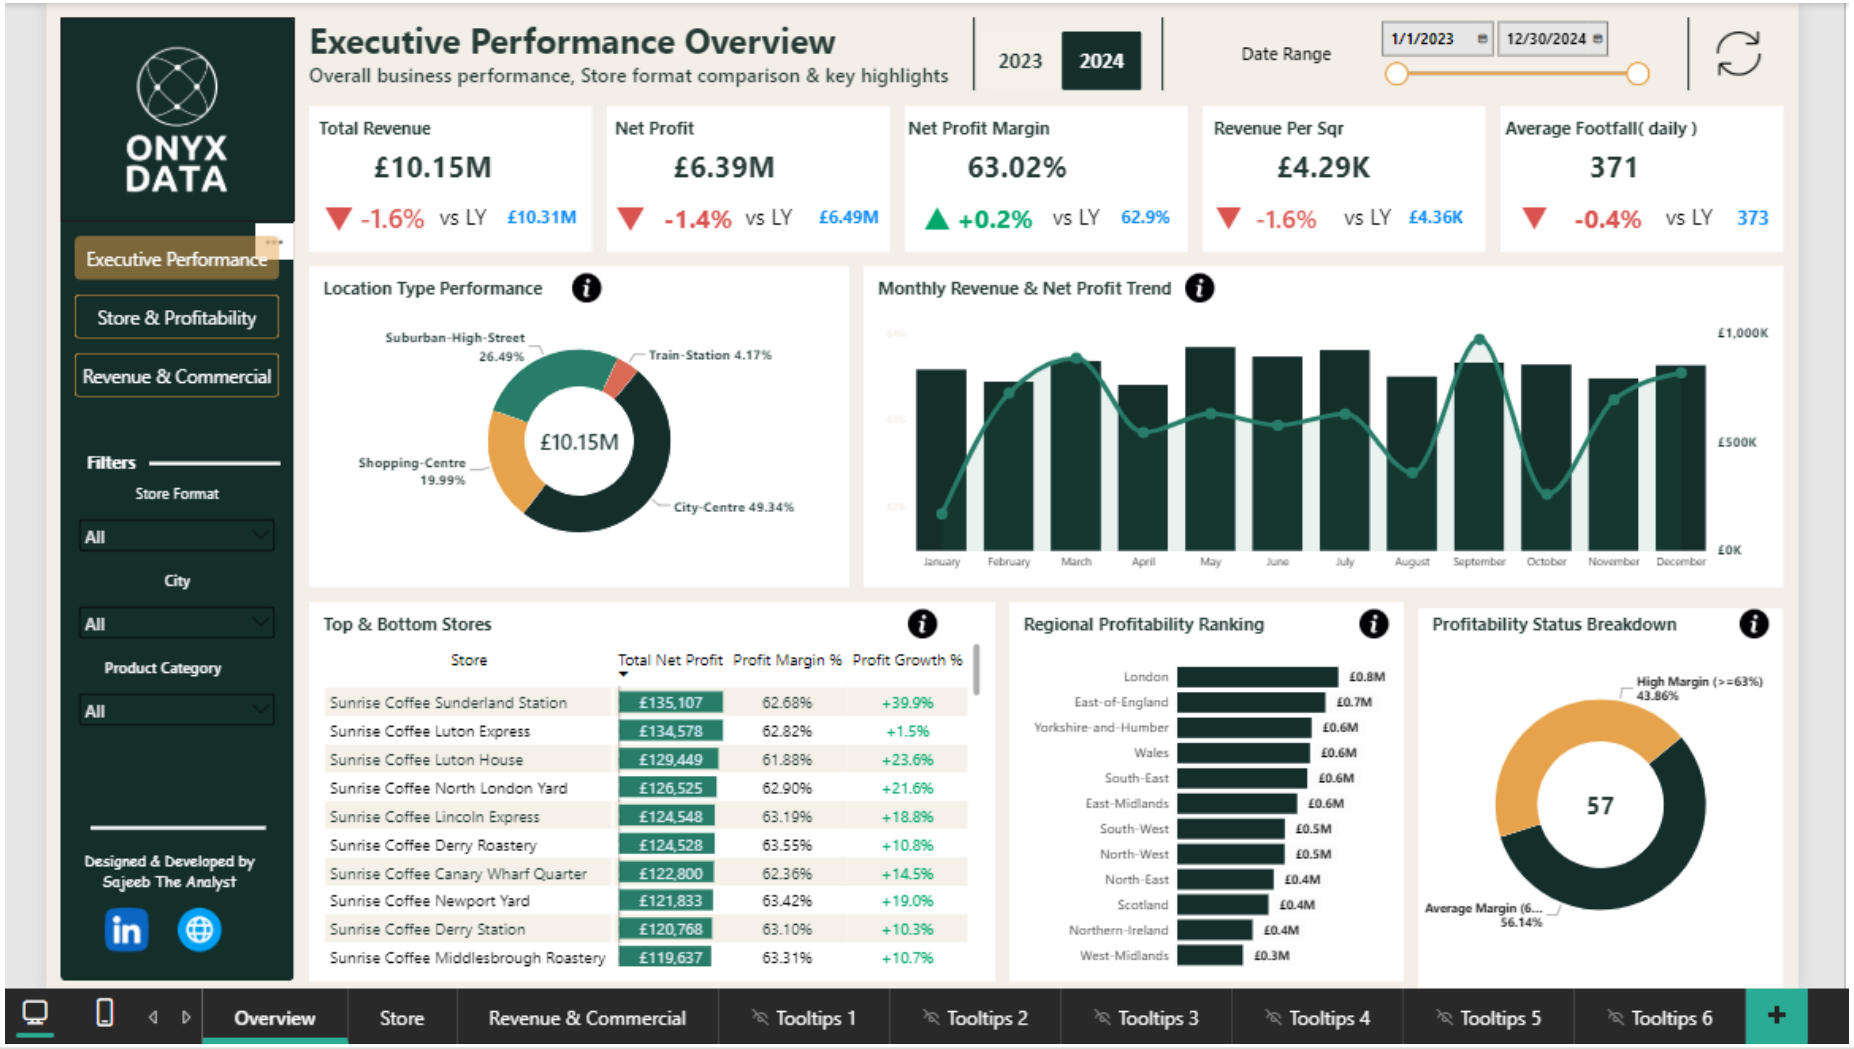

Success metric

Improve chain margin by reducing underperforming store loss months, increasing weekend/holiday revenue per transaction, and lowering rent/staffing drag in priority stores.

Inputs reviewed

- SQL Query Analyze notebook: saved SQL answers and result tables.
- Power BI dashboard screenshots: Overview, Revenue & Commercial, Store & Profitability.
- CSV model tables: dim_date, dim_product, dim_store, fact_daily_sales, fact_store_monthly_profitability.
- Generated workbook: sql_query_results.xlsx for consolidated SQL result review.

Interpretation note

Dashboard screenshots appear to show selected 2024 views, while the SQL and CSV analysis covers the full 2023-2024 source period. Where metrics differ by scope, this deck uses the dashboard for executive trend direction and SQL/CSV analysis for deeper operational drivers.
